Biochem. Biophys. Res. Commun. 211:586-589(1995).
-!- FUNCTION: May catalyze the degradation of intercellular cohesive
structures in the cornified layer of the skin in the continuous
shedding of cells from the skin surface. Specific for amino acid
residues with aromatic side chains in the Pl position. SCCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Skytt A., Stroemgyist M., Egelrud T., "Primary substrate specificity of recombinant human stratum corneum

cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-1-Tyr-26, and 26-Tyr-|-The-7). Could play a role in the activation of precursors to inflammatory cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.

I Proceed to a superagine-linked oligosaccharides of porcine pancreatic Allikreins.
I Kininogen to release Lys-bradykinin.
I CATALYTIC ACTIVITY: Preferential cleaves Met-Lys and Arg-Ser bonds in kininogen to release Lys-bradykinin.
I CATALYTIC ACTIVITY: Preferential cleaves of Arg-|-Xaa bonds in small in olecule substrates. Highly selective action to release kallidin (lysyl-bradykinin) from kininogen involves hydrolysis of Met-|-Xaa or Leu-|-Xaa.
I SUBUNIT: Monomer.
I SUBUNIT: Monomer.
I SUBUNIT: Belongs to peptidase family Sl. Kallikrein subfamily.
I CAUTION: Native porcine kallikrein is a monomer. Chains of the parcealic beta kallikrein are heterogeneous artifacts of

J. Storine proteases in rodent hippocampus.";
J. EUNCTION: Suggested to be involved in kindling epileptogenesis and hippocampal plasticity. Has a strong proteolytic activity against fibronectin (By similarity).
J. CARALYTIC ACTIVITY: Preferential cleavage: Arg., Lys.
J. SUBCELLUIAR LOCATION: Secreted (By similarity).
J. SUBCELLUIAR LOCATION: Secreted (By similarity).
J. SUBCIPICITY: Restricted to hippocampus.
J. SIMILARITY: Belongs to peptidase family SI. Kallikrein subfamily.

"Characterization of one novel venom protease with beta-fibrinogenase activity from the Taiwan habu (Trimereseurus mucrosquamatus): purification and CDNA sequence analysis.";

Biochem. Biophys. Res. Commun. 205:1707-1715(1994).

-! FUNCTION: Thrombin-like snake venom serine protease. Cleaves beta-chain of fibrinogen molecules efficiently and shows relatively lower activity on alpha-chain, with almost no activity on gamma-

    -!- SUBCELLULAR LOCATION: Secreted.
    -!- TISSUE SPECIFICITY: Expressed by the venom gland.
    -!- SIMILARITY: Belongs to peptidase family S1. Snake venom subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | MEROPE'S SULLIBS; -...

0

    enzymatic activity.
    SUGCELLUIAR LOCATION: Secreted.
    TISSUE SPECIFICITY: Expressed by the venom gland.
    SIMILARITY: Belongs to peptidase family S1. Snake venom subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      H HSSP; FUOTOS; CYS Ser_trypsin.

-!- FUNCTION: Functions in the N-end rule pathway of protein
degradation where it conjugates Arg from its aminoacyl-tRNA to th
N-termini of proteins containing an N-terminal aspartate or
glutamate (Potential).
-!- CATALXTIC ACTIVITY: L-arginyl-tRNA + protein = tRNA + L-arginyl-

screening for stratum corneum cnymotrypsin enzyme (SCCE). Froceases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human SCCE peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            39-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10-APR-2003
                                                                                                                                                                                                     ADA05736;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19-APR
                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (POR) primers, ollgomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal extivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic gene mapping, identification of mutations responsible for genetic gene mapping, identification of mutations responsible for genetic sequences and conducts dependent on DNA and amino acid sequences. Abg000010-Abg30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at the printed specification, but was obtained in electronic format directly from MIPO at

WO2003029424-A2

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more described above and a carrier; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for determining the presence or acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for cabove; (10) a method for identifying a potential therapeutic agent for a pathology associated with the polypeptide; (11) a method of a pathology associated with the above polypeptide; (11) a method of a pathology associated with the above polypeptide; (11) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide in a method for producing the above polypeptide or the nucleic and molecule may be used to diagnose, treat or prevent metabolic asyndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic cat metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, probes, in chromosome mapping, tissue typing, prevents and probes; in chromosome mapping, tissue typing, prevents a polyperied on the prese New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or Claim 1; Page 170; 586pp; English.

obesity, or New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics

Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the nucleic acid molecule described above; (5) a cell
prise to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
coplypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
the intracting a pathology that is related to an aberrant expression or
aberrant physiological interactions of the polypeptide; (11) a method of
screening for a modulator of activity or of latency or predisposition to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. B. coli) or eukaryotic and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzeimer's disease

The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid p5507. Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Example 6; Page 37; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence coding at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model to the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or resting of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an inflammatoxy skin diseases selected from diseases consisting of epidermal inflammation, pruritus, acopic dermatitis, eccame, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a composition for relieve of various skin diseases where itch is a composition for presents the N-reminal fragment of the human stratum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the transgenic mammals described in the invention where itch is a component. fragment of the human strat

Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Claim 10; Page 58-59; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model or its variant in skin. The product of the invention is useful as a model or ameliorate a pathogenic condition, for development or testing of a cosmetic or apharmaceutical formulation, and for the development of a diagnostic method. It can also be useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal composition effective for the prevention or treatment of not hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation, pruritus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful or as a model for further studies of itch mechanisms and the testing of epiderment or as a model for further studies for the menamal of the invention is also useful potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous protease synonymous corneum chymotryptic enzyme, SCCE which is a serine protease s with human kallikrein 7 (KLK7) and is used in the development transgenic mammals described in the invention

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) is useful for diagnosing a prostate cancer in a sample comprising profested tissue, which involves determining the number of the probability that the sample comprises the number is indicative of the probability that the sample comprises the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises of target genes which are differentially-regulated in prostate cancer. (I) is useful for identifying a prostate cancer, which involves concerned a spoke useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated cancer cells, which involves contacting a polypeptide differentially-regulated concerned in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) the test agent to modulate a biological activity of the polypeptide, and concerned in prostate cancer cells with a test agent under conditions especially relating to prostate cancer. (I) and its expression of products are used in the diagnostic test to assay for presence of cancer. (I) is useful and diagnostic test to assay for presence of cancer of cancer, its stage of development, the nature of genetic defect, etc. (I) and issue sections, in biopsy sample, in total NM, in lymph, in bloopsy and concerned in propagate and the delinest cancer. (I) and stage of development, the nature of genetic defect, etc. (I) and specific binding partners of the polypeptide and thus concerned in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways and the delinest of a protein differentially the are useful in disagnostic, ther regulated in prostate cancer

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises for prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue in target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels in a sample comprising prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is uncein a smolecular markers, as drug targets, and for detecting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diagnosing, stading, grading, assessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in biopsy sample, in total RNA, in lymph, in blood etc. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus

The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
for searching specific binding partners of the polypeptide. (1) is useful in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathway which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein differentially regulated in prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human stratum corneum chymotryptic enzyme - ovarian cancer clone O1676P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence is human stratum corneum chymotryptic enzyne (HSCEB), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine proteins enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic cids encoding kallikrein-like proteins KKK-Li, KKK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human gastric cancer associated antigen protein sequence SEQ ID NO:942.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 propresent nucleotide sequences encoding human breast, gatartic and prostate cancer associated antigen precursors (CAAP) respectively.

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gatartic and prostate (CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein, e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page 625; 799pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                           March 1, 2004, 17:21:46 ; Search time 11.8889 Seconds

Application US/08930188
Patent No. 603337
GENERAL INFORMATION:
APPLICANT: Dixon, Eric P.
APPLICANT: Dixon, Eric P.
APPLICANT: Little, Sheila P.
TITLE OF INVENTION: AMYLOID PRECURSOR PROTEIN PROTEASE AND TITLE OF INVENTION: RELATED NUCLEIC ACIDS
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: Eli Lilly and Company
STREET: Lilly Corporate Center
CITY: Indiana
CONTY: Indiana
CONTY: United States of America
ZIP: 46285 Ploppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: Ploppy disk
COMPUTER: IEM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOGTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA: US/08/930,188
                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: ARENGINGS ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARENGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AVMERS: US/09/252,991A

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 22870

LENGTH: 569

TYPE: PRT

ORGANISM: Pseudomonas aeruginosa

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

a

cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines. -!- TISSUE SPECIPICITY: Abundantly expressed in the skin and is expressed by kerathocytes in the epidermis. Very low levels are also seen in the brain and kidney. -!- SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.

ROHINGTON: Political analysis of more than 15,000 full-length

R. Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

CC II- FUNCTION: Petrase accelerate the folding of proteins during protein synthesis.
-!- CATALYTIC ACTIVITY: Peptidylproline (omega=180) = peptidylproline

RESPECTIVEN: THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND.

INHIBINS/ACTIVENS. THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND.

INHIBINS/ACTIVENS ARE INVOLVED IN REGULATING A NUMBER OF DIVERSE FUNCTIONS SUCH AS HYPOTHAMIC AND PITUITARY HORMONE SECRETION, GRANDAL HORMONE SECRETION, GRAN CELL DEVELOPMENT AND MATURATION, EXTHROID DIFFERENTIATION, INSULIN SECRETION, NERVE CELL SURVIVAL, EMBRYONIC AXIAL DEVELOPMENT OR BONE GROWTH, DEPENDING ON THEIR SUBJURIT COMPOSITION. INHIBINS APPEAR TO OPPOSE THE FUNCTIONS OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDIINE=99027340; Pubmed=9801457;

"Structural similarity between bovine conglutinin and bovine lung surfactant protein D and demonstration of liver as a site of surfactant protein D and demonstration of liver as a site of surfactant protein D and demonstration of liver as a site of surfactant protein D and demonstration of liver as a site of Immunology 78:159-165(1993).

-!-PUNCTION: Contributes to the lung's defense against inhaled microorganisms. Binds strongly malcose residues and to a lesser extracellular reorganization or tunnover of pulmonary surfactant.
-!-SUBJMIT: Oligomeric complex of 4 set of homotrimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Young N.M., Leon M.A.;
Theo marbohydrate specificity of conglutinin and its homology to proteins in the hepatic lectin family.";
Biochem. Biophys. Res. Commun. 143:645-651(1987).
-: FUNCTION: Calcium-dependent lectin-like protein which binds to a yeast cell wall extract and immune complexes through the complement component (C3bi). It is capable of binding nonreducing terminal N accetylglucosamine, mannose, and fucose residues.
-: SUBUNIT: Oligomeric complex of 4 set of homotrimers.
-: SIMILARITY: Contains 1 collagenous domain.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

-- FUNCTION: Involved in the maintenance of nuclear organization and structural innegrity. Probable anchoring protein which therers the nucleus to the cytoskeleton. Connects nuclei to the cytoskeleton by interacting with the nuclear envelope and with F-actin in the cytoplasm.

--- SUBUNIT: Interacts with MUSK, with F-actin via its N-terminal domain, and with LIMA in vitro (By similarity).

---- SUBCELLULAR LOCATION: Type IV membrane protein (Potential). The Jargest part of the protein is cytoplasmic, while its C-terminal counter nuclear membrane. In skeletal and smooth muscles, a significant amount is found in the sarcomeres.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isoid=Q@NF91-9; Sequence=VSP 007133, VSP 007143, VSP 007144;
TISSUE SPECIFICITY: Widely expressed. Highly expressed in skeletal and smooth muscles, heart, spleen, and peripheral blood
                                                                                    [13]
